

What is MobilePay®?

e-Nabler MobilePay® is a complete wireless retail payment solution designed for "on-the-go" retailers, to provide the ability to accept credit card payments and perform check conversion (ACH) in a wireless point-of-sale that works with almost any handheld PC with Pocket PC operating system. This solution uses and integrates wireless technology such as: Wi-Fi, CDMA, or GSM/GRPS.

Key features include payment acceptance of all major credit cards, check cards, check conversion and check guarantee services through major credit card processors like Global Payments and many others. The application is fully supported locally by e-Nabler Corporation. The application's "ease of use" design runs on a PocketPC device, like an HP iPAQ, or any other PocketPC computer with wireless capabilities and integrates peripherals such as an integrated portable printer/card reader.

Target Market: Specialty retailers, restaurants, service industries, wholesalers, merchandisers, general retailers, direct marketers (MOTO), and vendors who service mobile and temporary locations such as stadiums, convention centers, parking lots, outdoor concessions, taxi drivers, tow trucks, delivery services, etc.

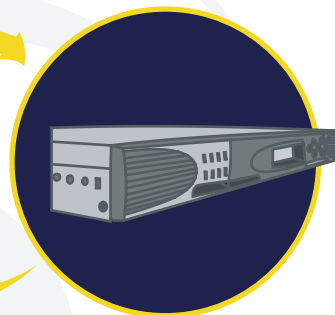

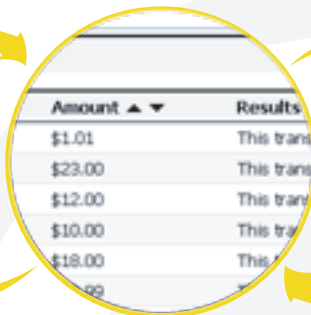

"Wireless retail payment solution designed for "on-the-go" retailers"

How does MobilePay® work?

Windows Mobile PocketPC

Web Based BackOffice

Credit Card Processor

e-Nabler MobilePay® can operate independently for payment acceptance only, or it can be integrated with our ActiSales application software to additionally transfer the payment transaction so that it can be recognized as a payment in your accounting software
